Be CovidSafe

**HOW MRNA VACCINES FOR COVID-19 WORK**

---

MRNA is injected into the arm muscle and enters immune cells

The MRNA gives our immune cells the instructions to make part of the “spike protein”, a harmless part of the covid virus.

---

The cells display copies of the spike protein and the immune system learns to recognize it. The MRNA is broken down after the instructions are used. The immune cells create antibodies that have the ability to recognize and fight against Covid-19 cells.
